# Investigate the use of CAWV AMVs from GOES-13/15 for GFS DAS

- Description and Motivation
- Quality Control
- Observation Error
- Analysis Impact
- Forecast Skill Impact

# Clear Air Water Vapor AMVs

## Description:

Motion derived by tracking moisture gradients in clear target scenes using GOES 13/15 Channel 3 with center frequency at  $6.5 \mu\text{m}$

Height is assigned using a cold sample of pixels in the scene which are compared to the forecast temperature profile for a height estimate

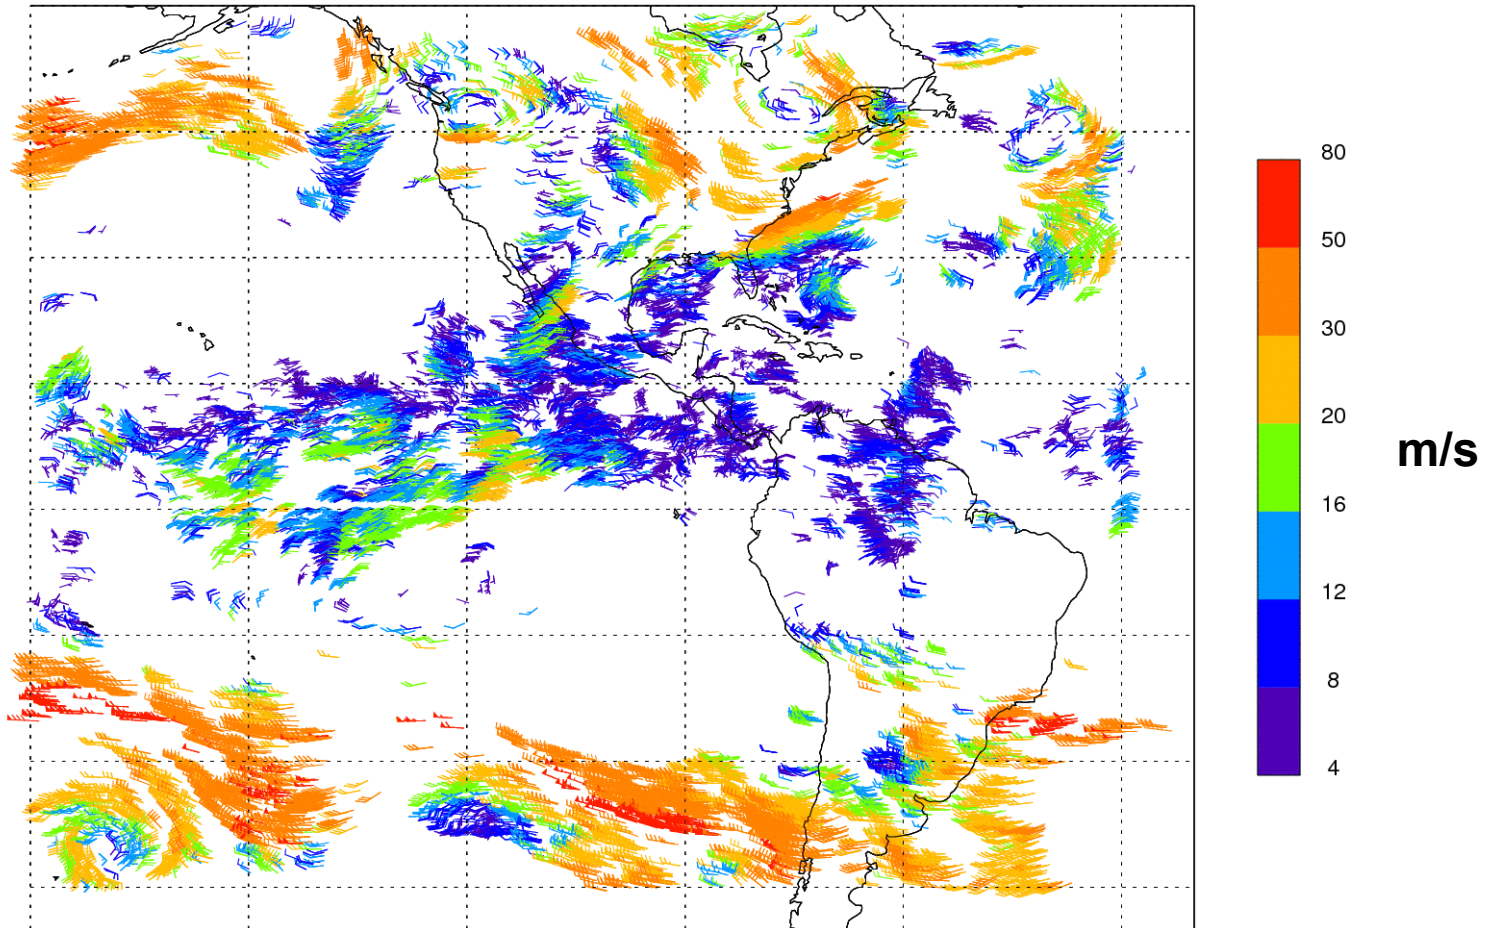

GOES-15 Imager Weighting Functions

# Motivation: Improve data coverage in the tropics

GOES IR & Cloud Top WV AMV above 500 hPa

No Clear Air WV AMVs

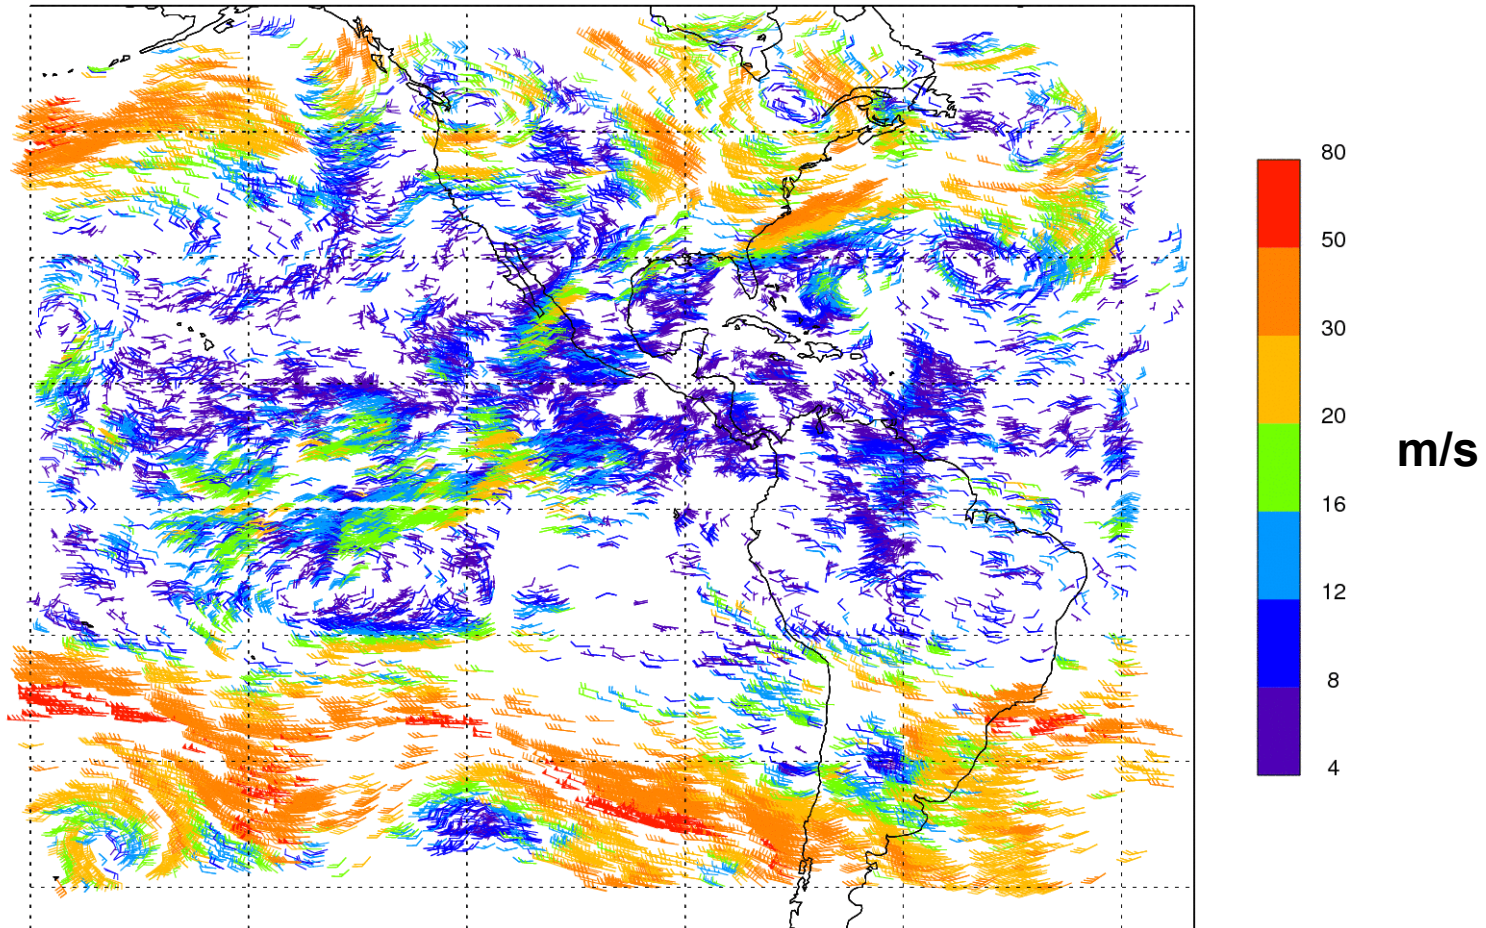

18Z 15 Aug 2014

# Motivation: Improve data coverage in the tropics

GOES IR & Cloud Top WV AMV above 500 hPa

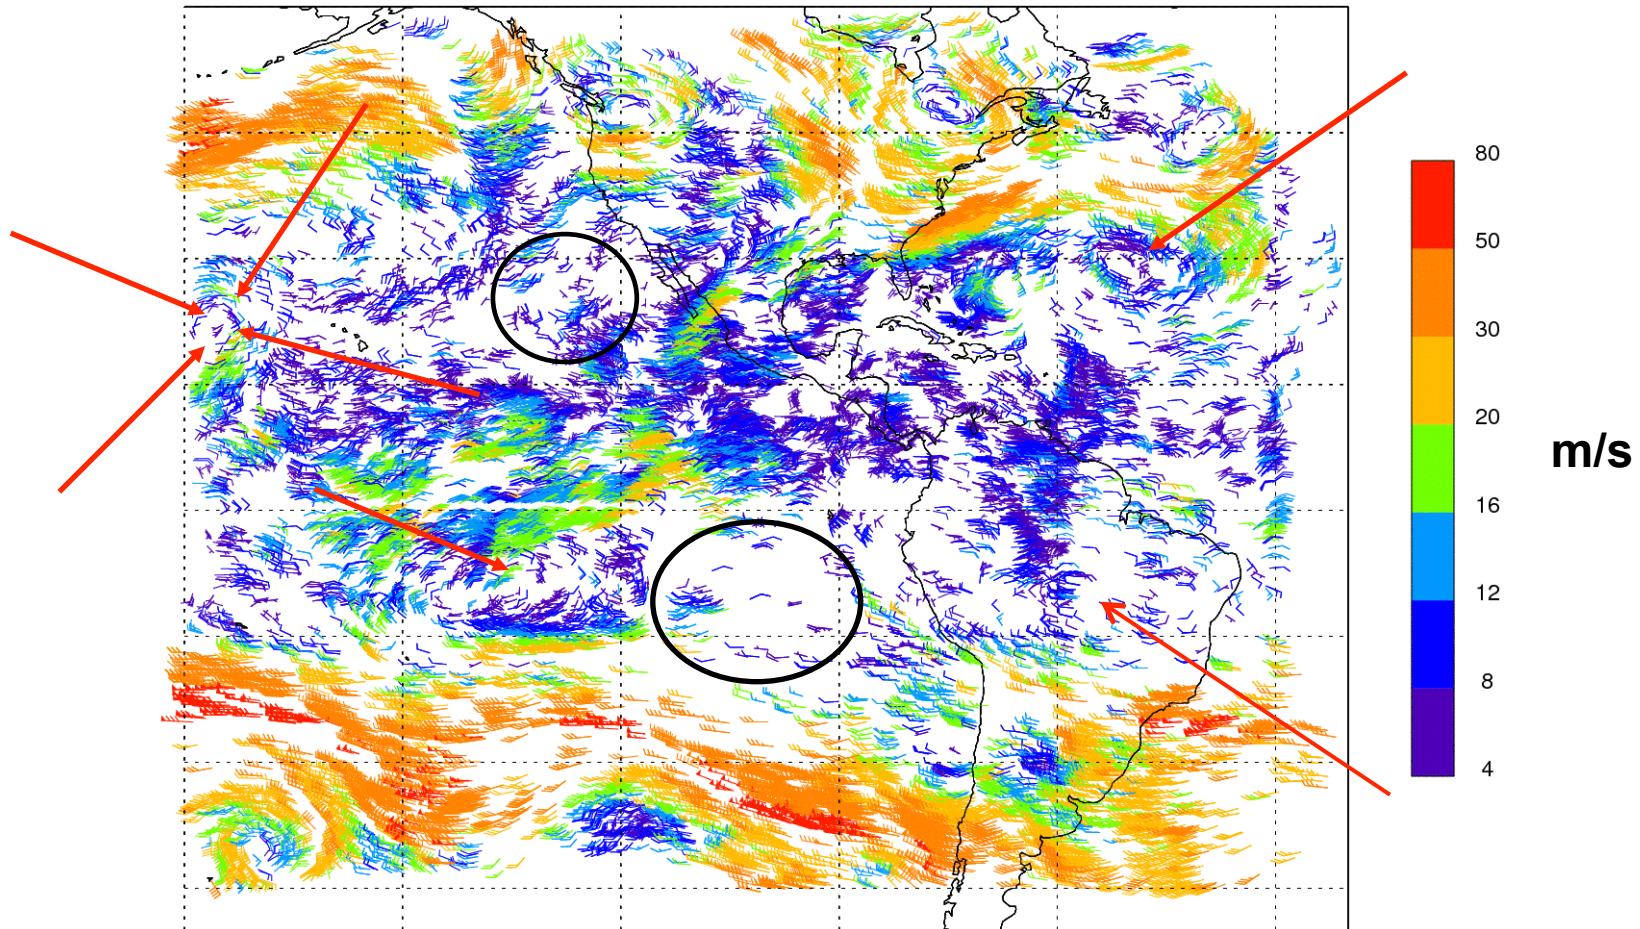

With Clear Air WV AMVs

18Z 15 Aug 2014

# Motivation: Improve data coverage in the tropics

GOES IR & Cloud Top WV AMV above 500 hPa With Clear Air WV AMV

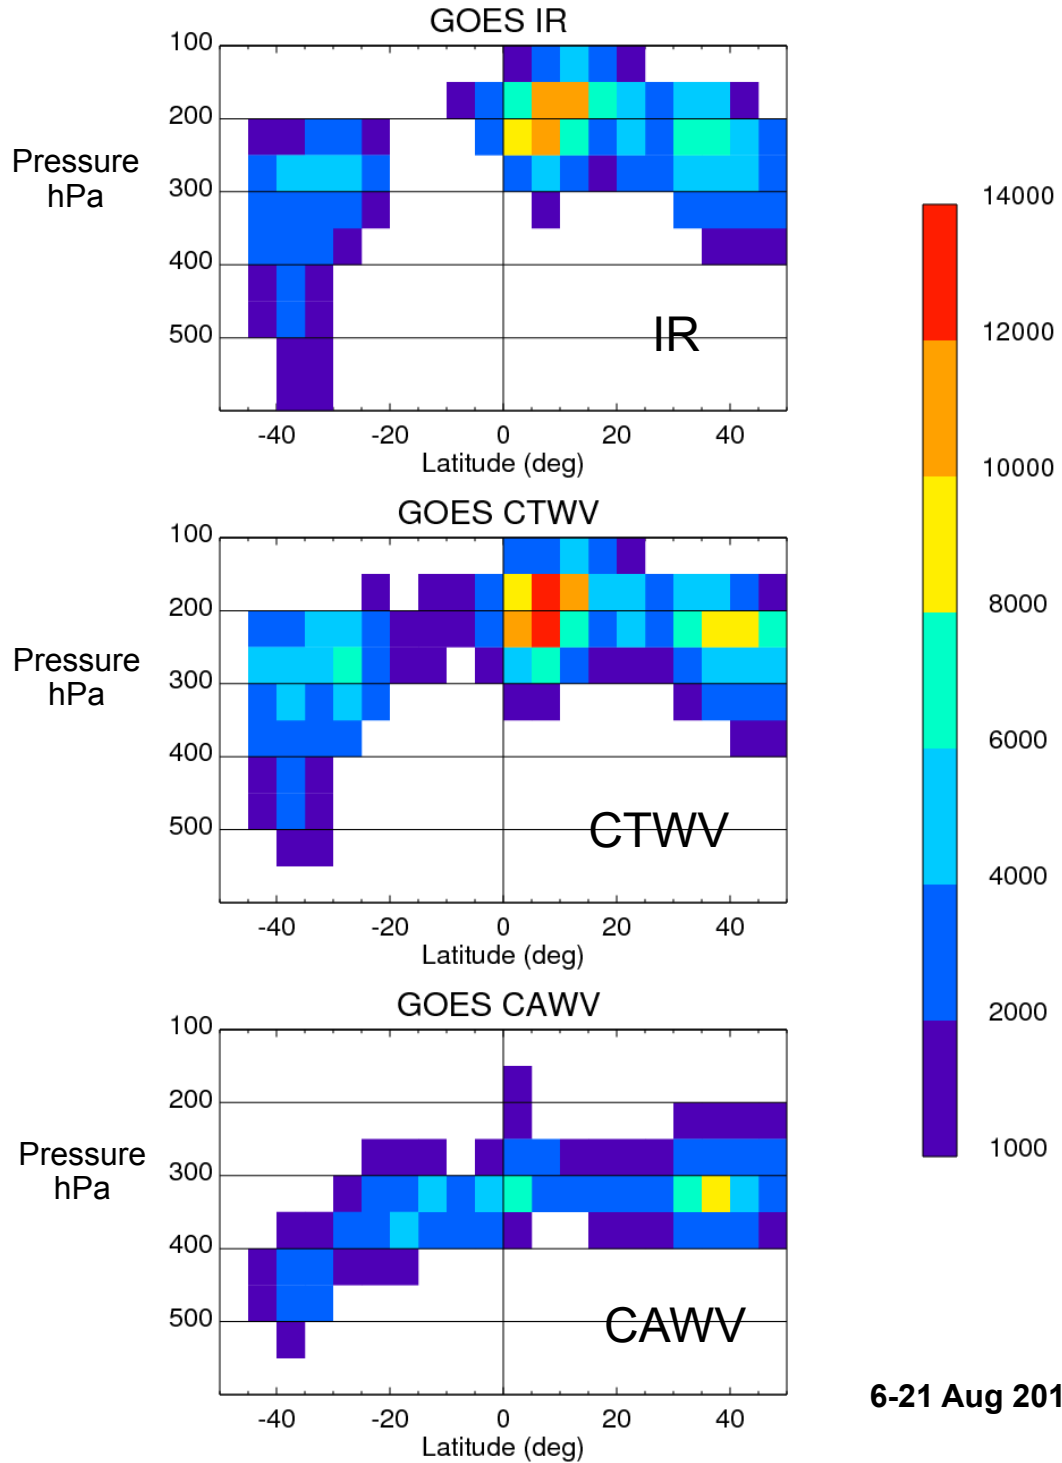

Features that need to be in the analysis

Regions where QC is needed  
How can consistency be improved?

# Location of GOES AMVs

CAWV are located lower than IR and CTWV

AMVs with Speed > 10m/s

Data Count

Number in the Lat/Prs Bin

6-21 Aug 2014

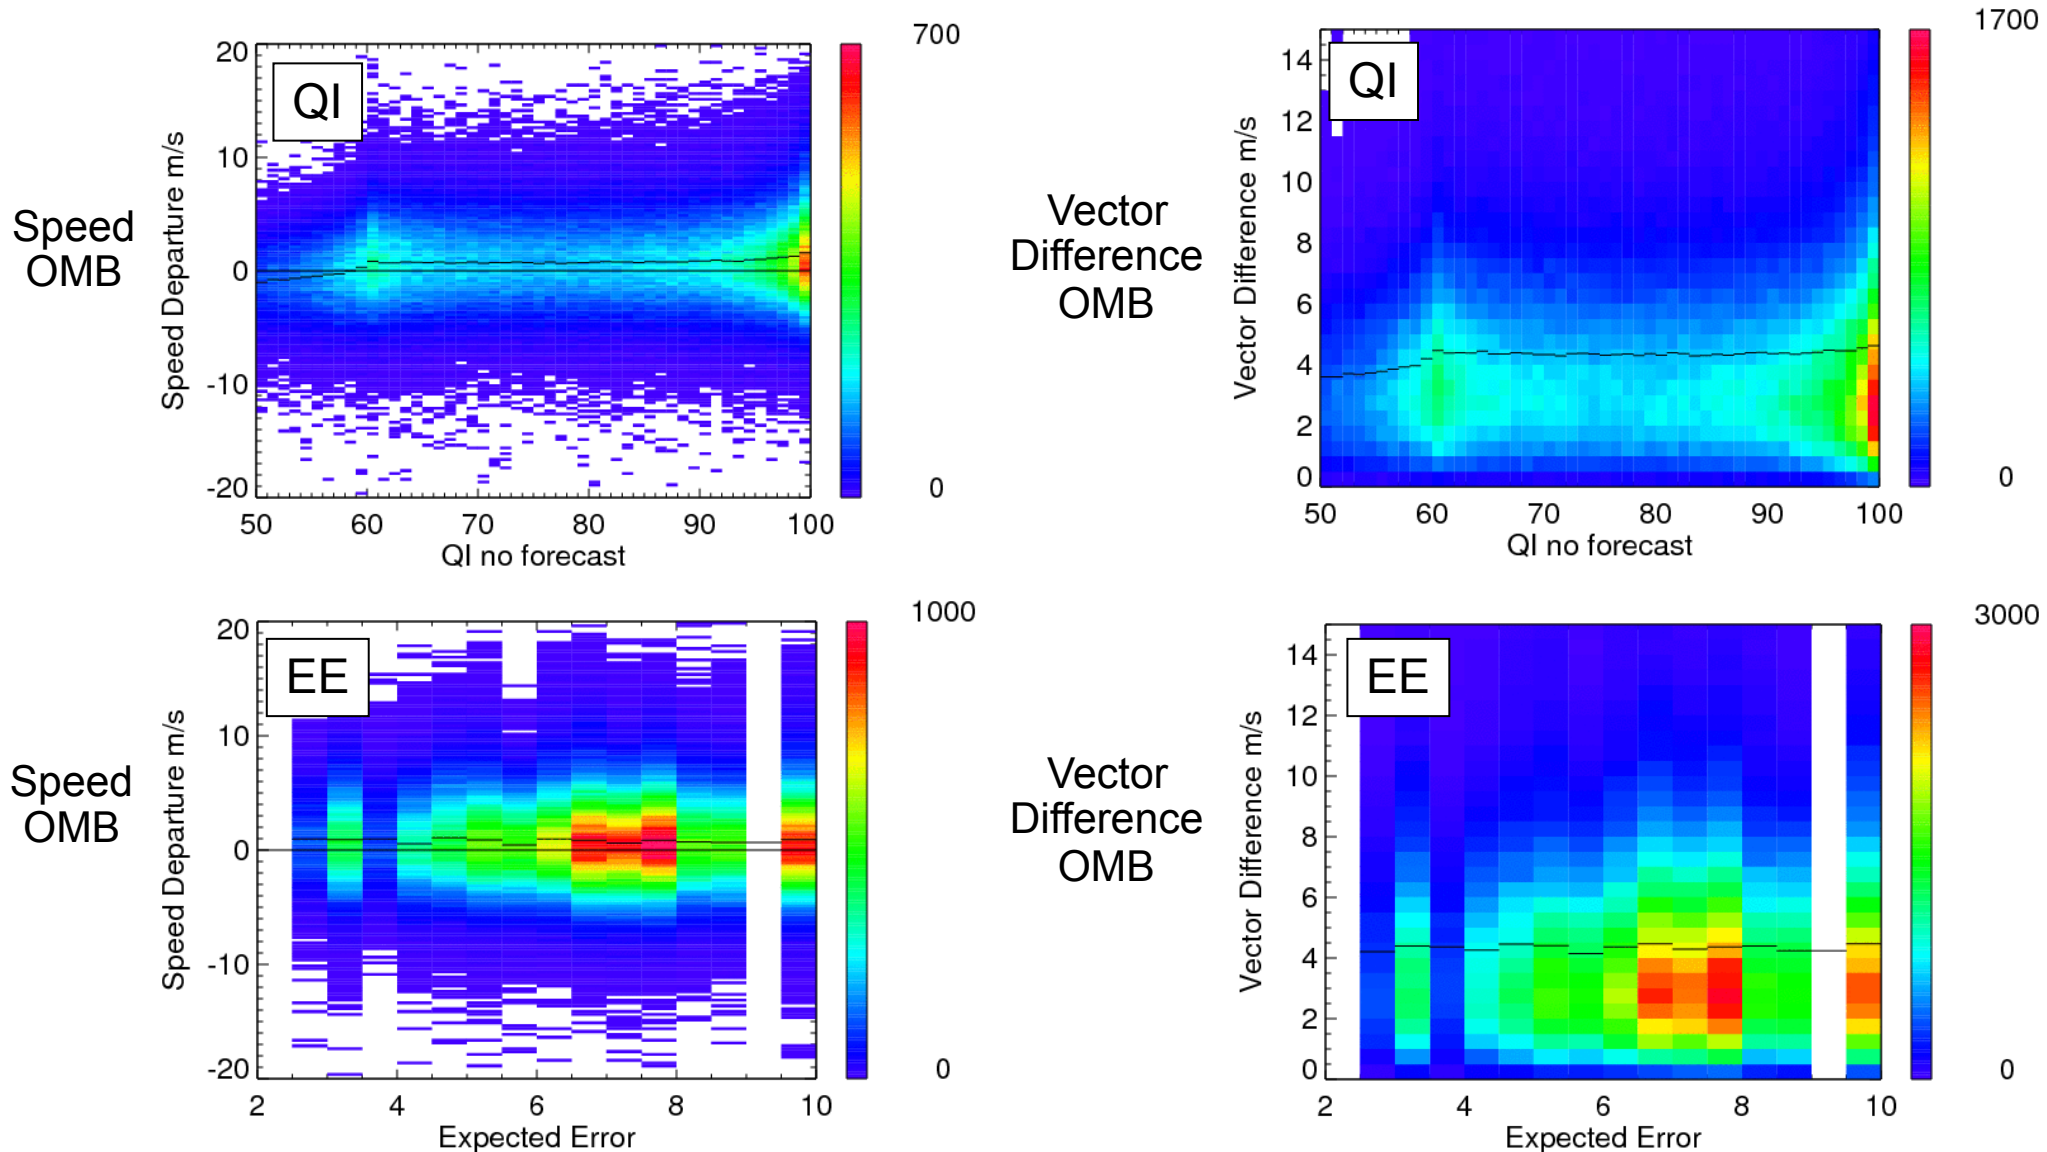

# Quality Control

Quality Indicator (QI) without the forecast component and Expected Error (EE)

High values of QI and low values of EE should indicate better quality AMV data

Neither parameter show skill in predicting AMV departure from the GFS first guess

**Vector Difference =  $\sqrt{(U_{AMV}-U_{GFS})^2 + (V_{AMV}-V_{GFS})^2}$**   
**Color indicates number of data in the 2d histogram bin**  
**Black line shows average value for the given x bin**

6-21 Aug 2014

# Quality Control

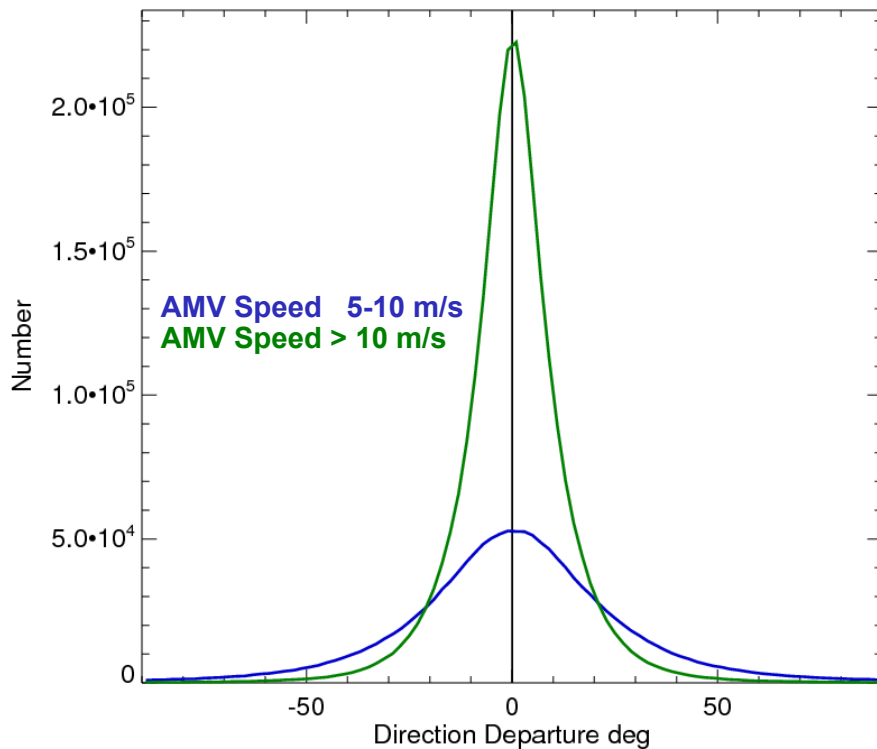

Minimum speed requirement: 10 m/s. Conservative, could be relaxed for GOES-R

Maximum direction departure: 50°

Near surface check over land

Apply the Log Normal Vector Difference (LNVD) constraint:  $LNVD < 3$

$$LNVD = \frac{\text{Sqrt} [ (U_{AMV} - U_{GES})^2 + (V_{AMV} - V_{GES})^2 ]}{\text{LN}(\text{Speed}_{AMV})} < 3$$

July 2015 Direction OMB

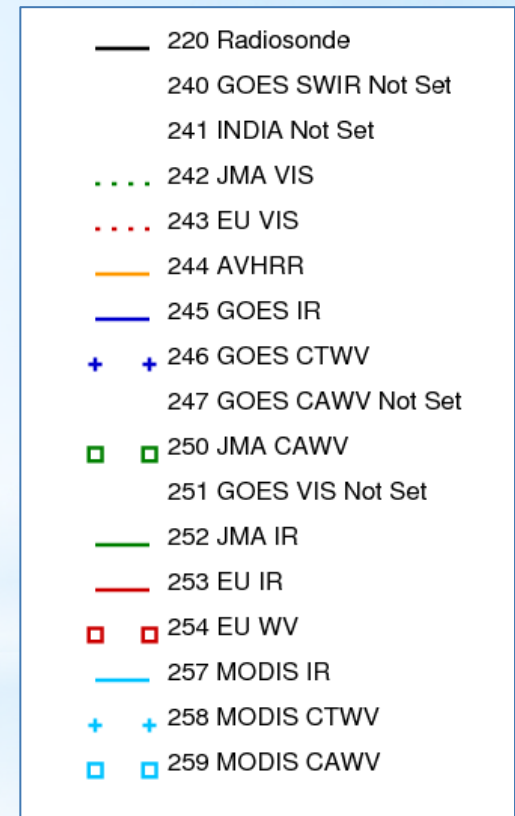

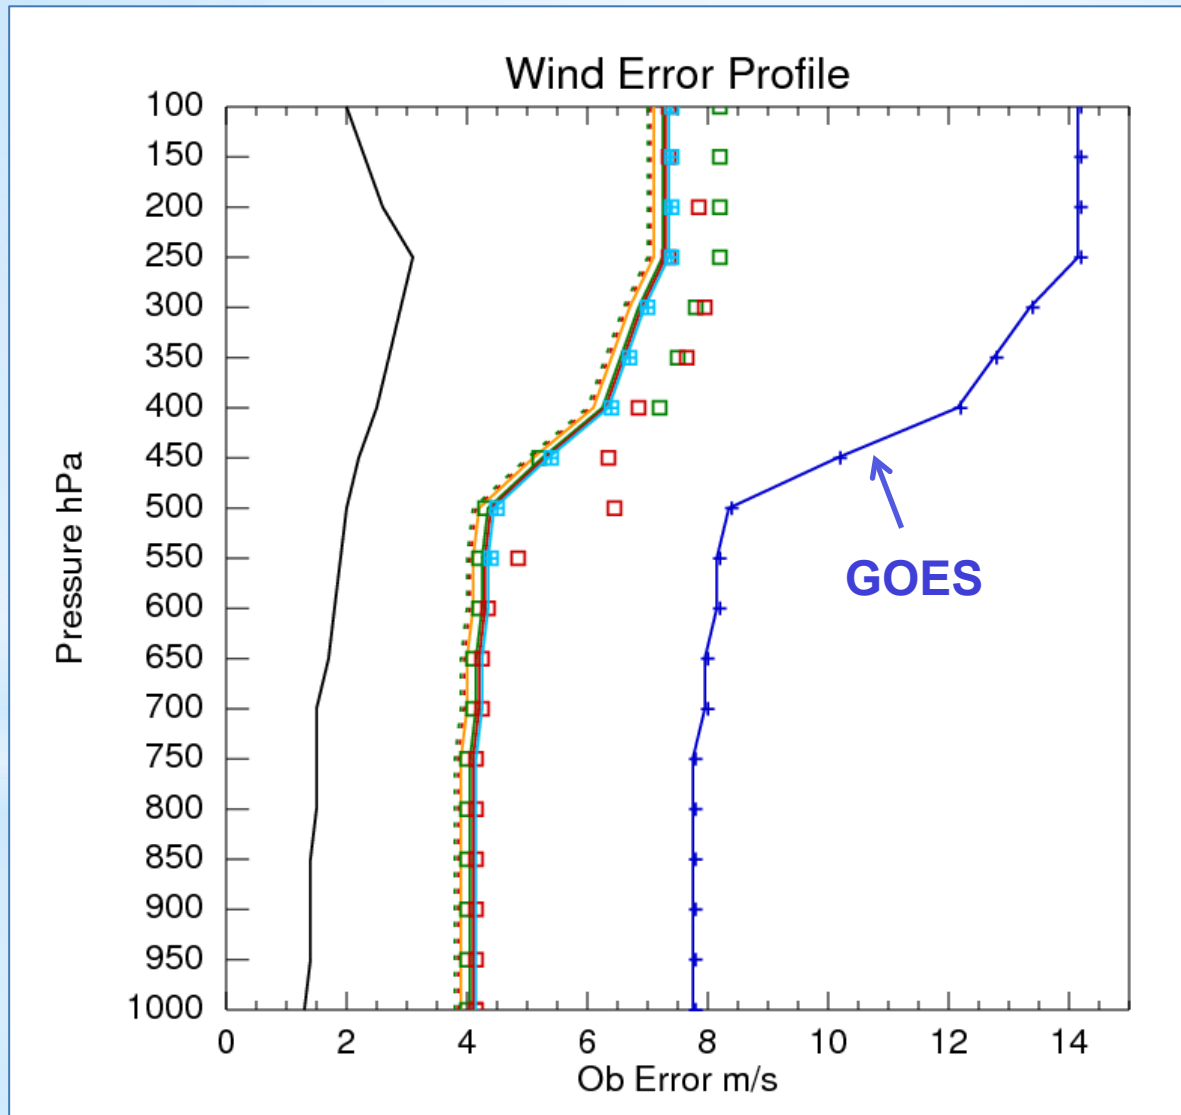

## More about LNVD:

- LNVD was first introduced for MODIS AMV QC
- As AMV speed increases, allowed speed departure increases while allowed direction departure decreases
- For slow AMVs, less speed departure allowed but larger direction departure is allowed
- Should reevaluate limit for regional or hurricane applications or remove entirely
- With a speed minimum of 10 m/s, the  $LNVD < 3$  also limits the direction departure to less than 50°

# Observation Error Current settings for AMV observation errors in GFS

## GOES IR and CTWV AMV error profiles

Increased to account for the higher data volume when temporal frequency increased to hourly winds

# Observation Error

Justify using same error settings by comparing OMB statistics of IR and CTWV with CAWV

OMB Departures for CAWV are largest in the Eastern Pacific where current operational data is sparse.

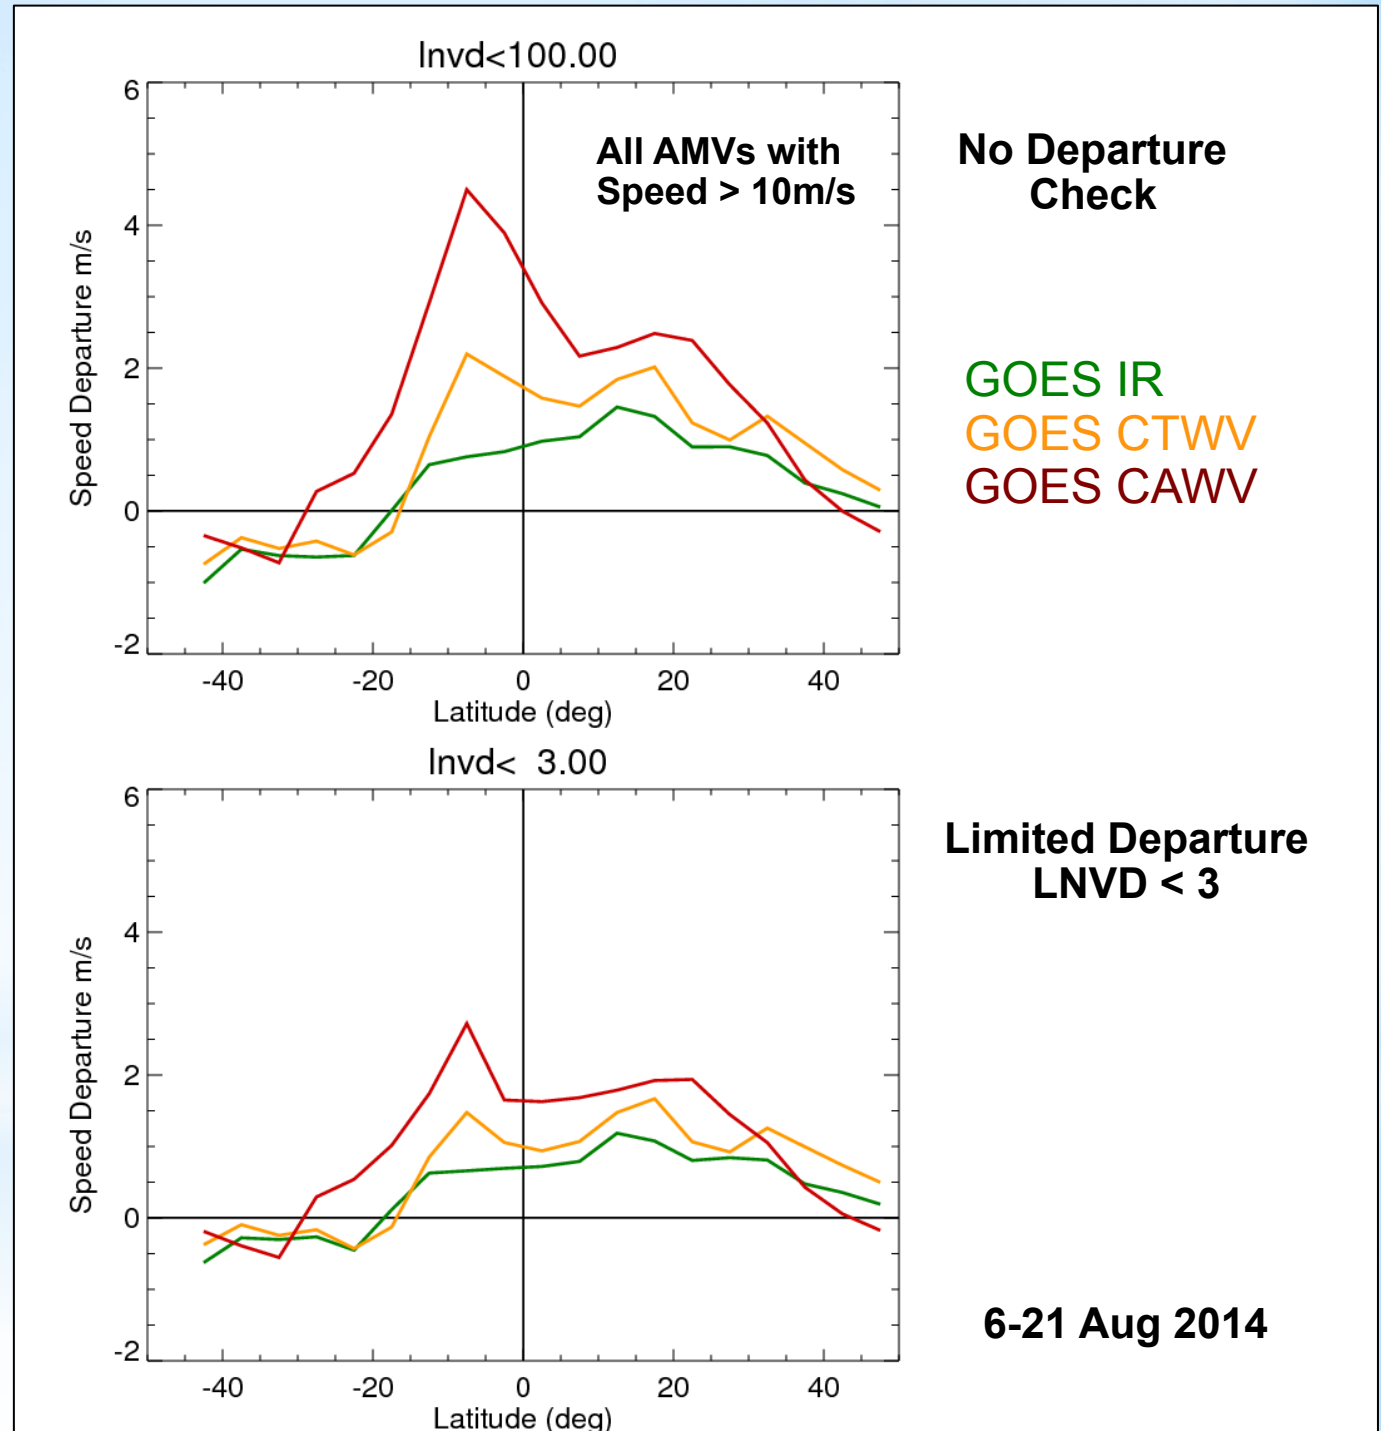

# Observation Error

Mean Speed OMB m/s  
as a function of Latitude

CAWV have larger positive  
speed bias but similar behavior

Setting the minimum speed to  
10 m/s increases the mean  
speed OMB for all AMV types  
but similar relationship exists

Positive bias could be due to  
height assignment for the  
layer movement

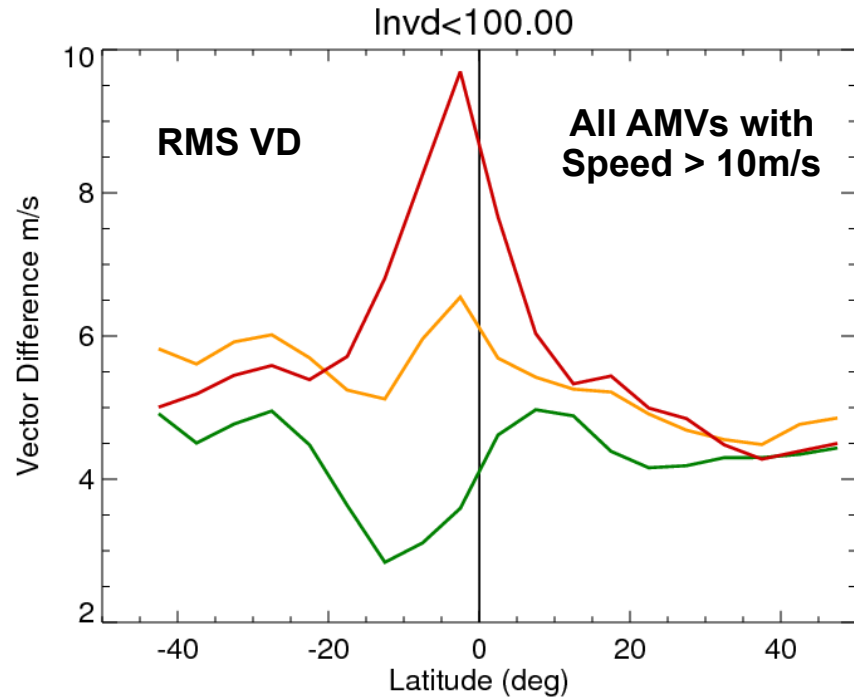

# Observation Error

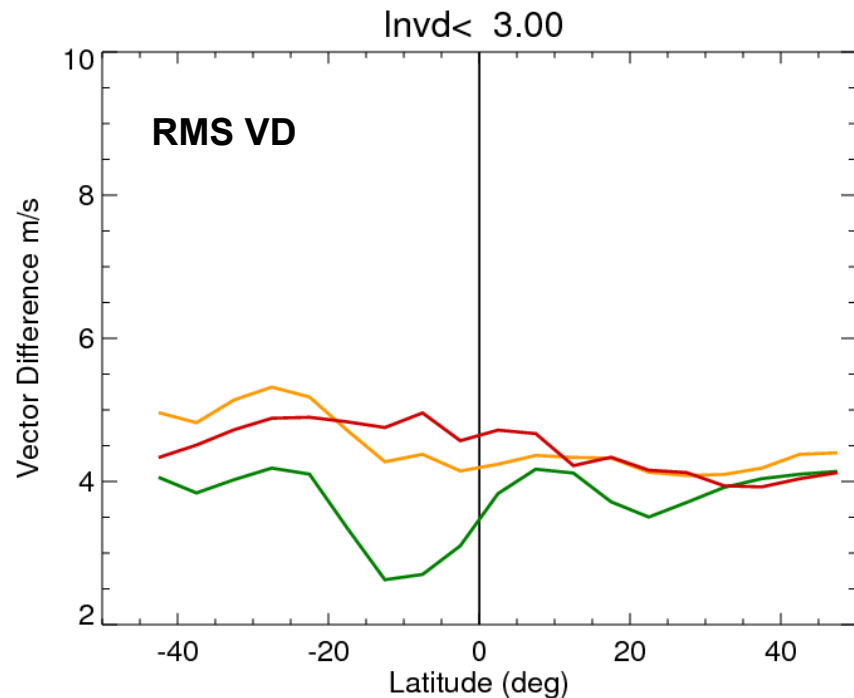

RMS Vector Difference OMB  
as a function of Latitude

CAWV have similar  
RMS vector difference  
largest in the tropics and  
is much lower than the  
12-14 m/s error specified  
For GOES IR and CTWV AMVs

No Departure  
Check

GOES IR  
GOES CTWV  
GOES CAWV

Limited Departure  
LNVD < 3

6-21 Aug 2014

# Analysis and Forecast Skill Impact

## GFS Hybrid ENKF T670-T254 - 2 seasons

1. July-Sep 2015 Experiment wve1, Control wvc1
2. Feb-Mar 2015 Experiment wve2, Control wvc2

Results show changes to the analysis circulation  
~350 hPa in the tropics

Short term impact ~24 hours on the wind forecast skill  
otherwise neutral impact in global and regional statistics

July-Sep 2015

# Summary

Clear Air Water Vapor AMVs provide data coverage in locations which currently do not have other AMVs

GOES CAWV AMV data is already available

QC changes for GFS use were straight forward

Analysis impact largest in tropics at 350hPa

Forecast skill impact was neutral
