14th INTERNATIONAL WINDS WORKSHOP, April 23 - 27, 2018 Jeju City, South Korea

Outline

- The NWP systems configuration
- Activities related to wind data
- Impact of retrieved wind data in the analysis system
- Impact of retrieved wind data on the forecast system
- Summary

The NWP systems configuration

Operational/experimental domains

Experimental setup

Model cycle: (Harmonie cycle 38h1.1)

- Domain: AROME-Arctic/METCOOP (750x960)
- Model level definition: 65 level
- Horizontal resolution 2.5 km
- Non-hydrostatic dynamic
- Physical parametrisation: HARMONIE-AROME
- Data assimilation: 3D-VAR

OI for surface

- 3-hourly cycling
- Lateral boundary conditions: ECMWF
- Using all observations from MARS archive
- Background error statistics computed as mean over 4 seasons
- Observations: Conventional, ATOVS, IASI, **Polar and Geo AMVs**

Activities related to retrieved wind data

- **Two regional reanalysis Projects:**
 - Copernicus Regional Arctic and European Reanalysis

Source: <http://www.euro-cordex.net/060374/index.php.en>

Model: ALADIN, 5.5km resolution
period: early 80's – 2021

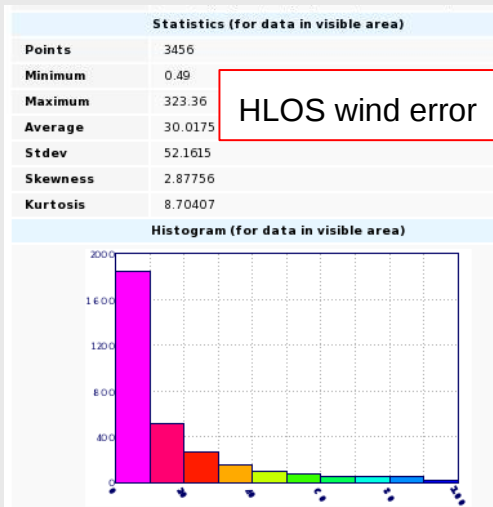

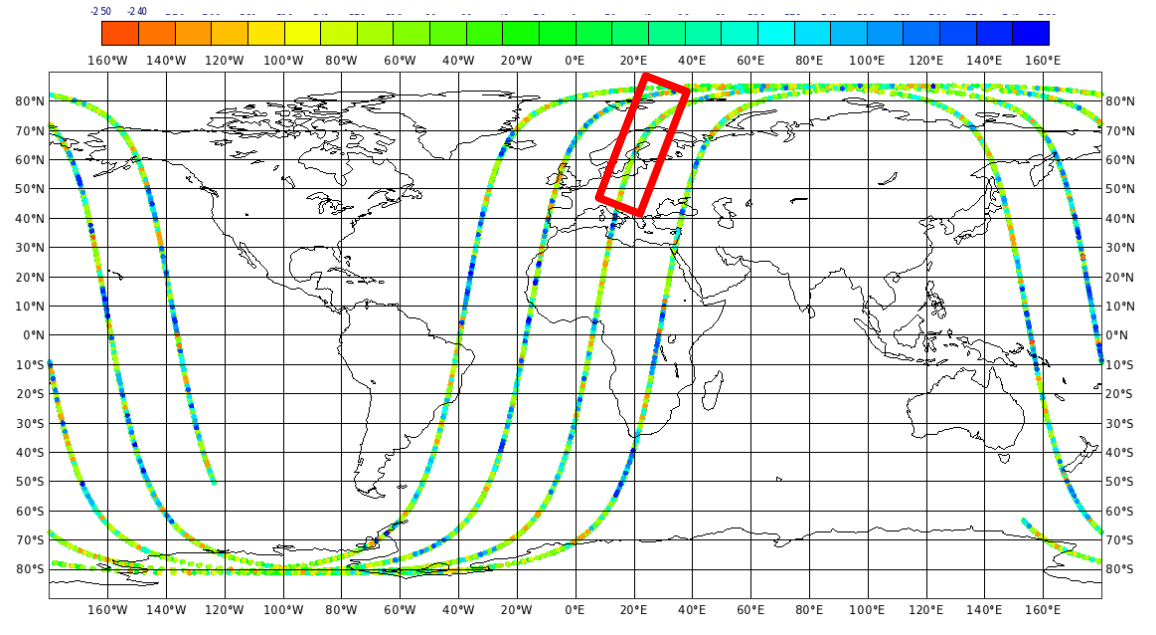

Model: HARMONIE-AROME, 2.5km resolution
period: 1997 – 2021

Activities related to wind retrievals

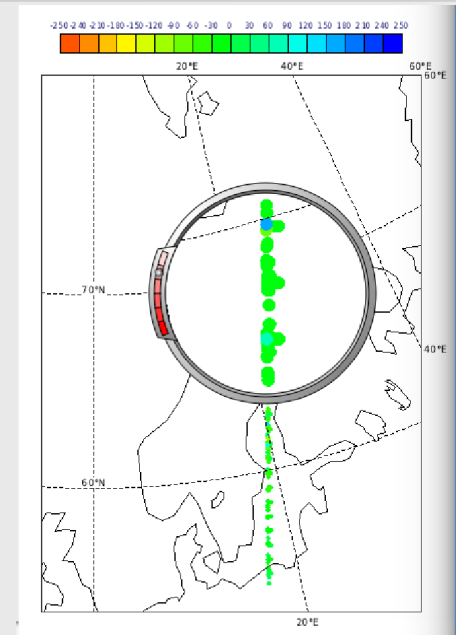

External projects:

PRODEX: CAL/VAL with Aeolus HLOS

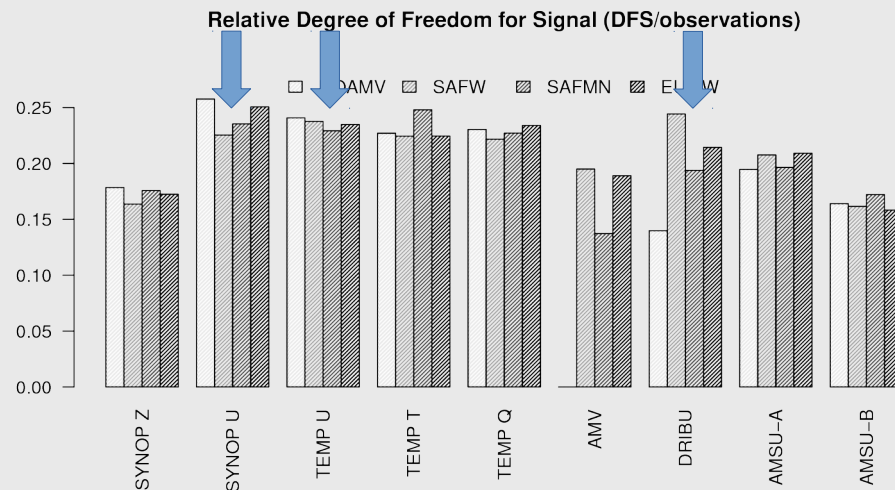

Horizontal line of sight wind (m/s)
2015100104-2015100109

This is work in progress.
HARMONIE-AROME DA
(CY43)
system is used as tool
for comparison

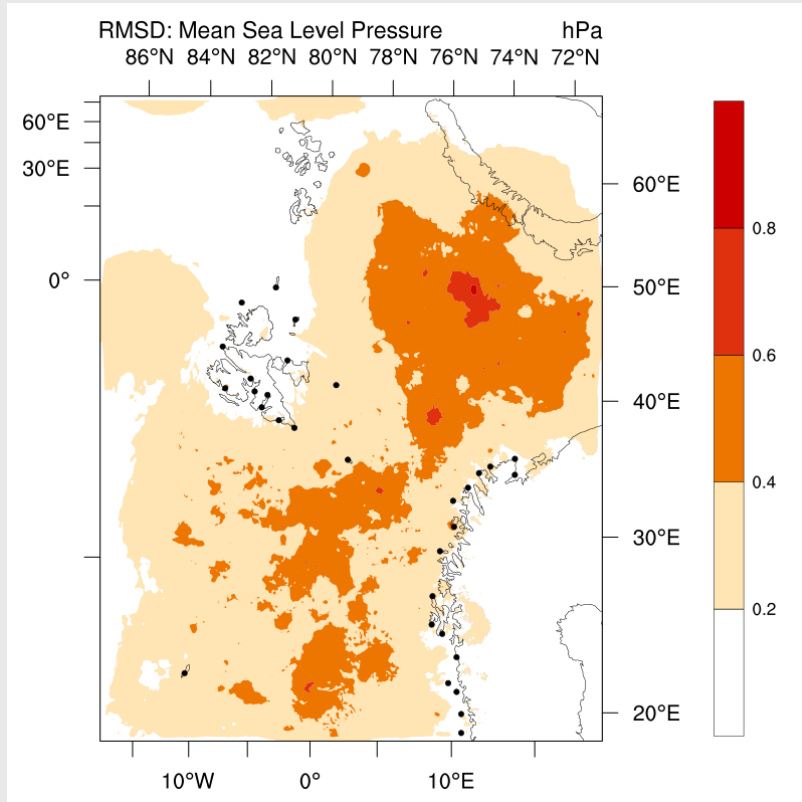

Impact of retrieved wind (geowinds) in the analyses

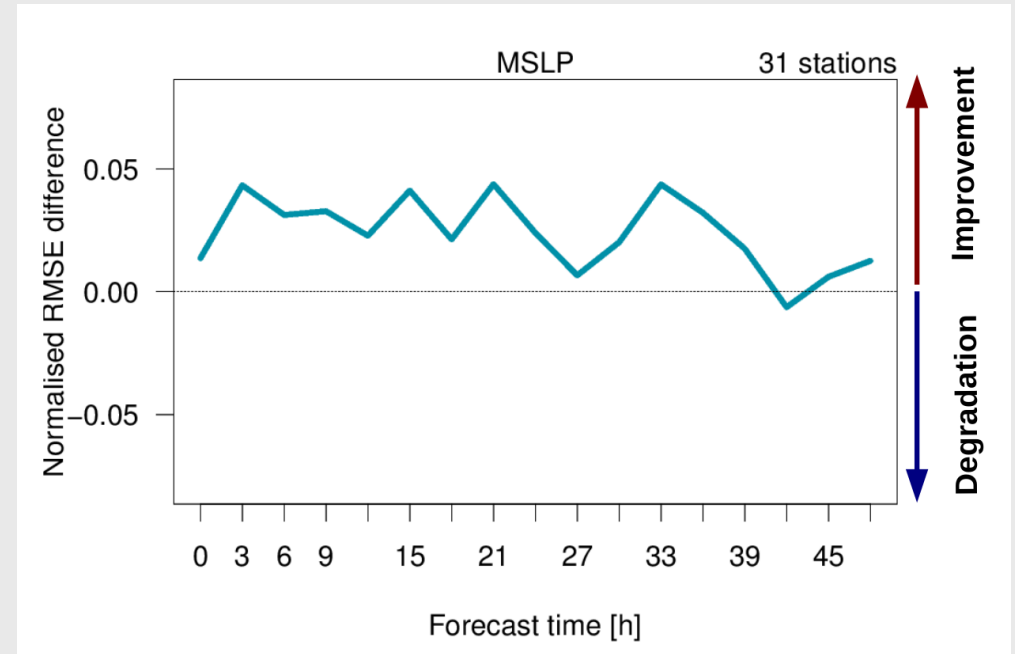

Assimilation of the Geowind data reduces the influence of the surface (ex. wind and Dribu) observations on the analysis

Impact of ASCAT wind data on analyses and forecasts

ASCAT data has slightly positive impact on MSLP and wind speed

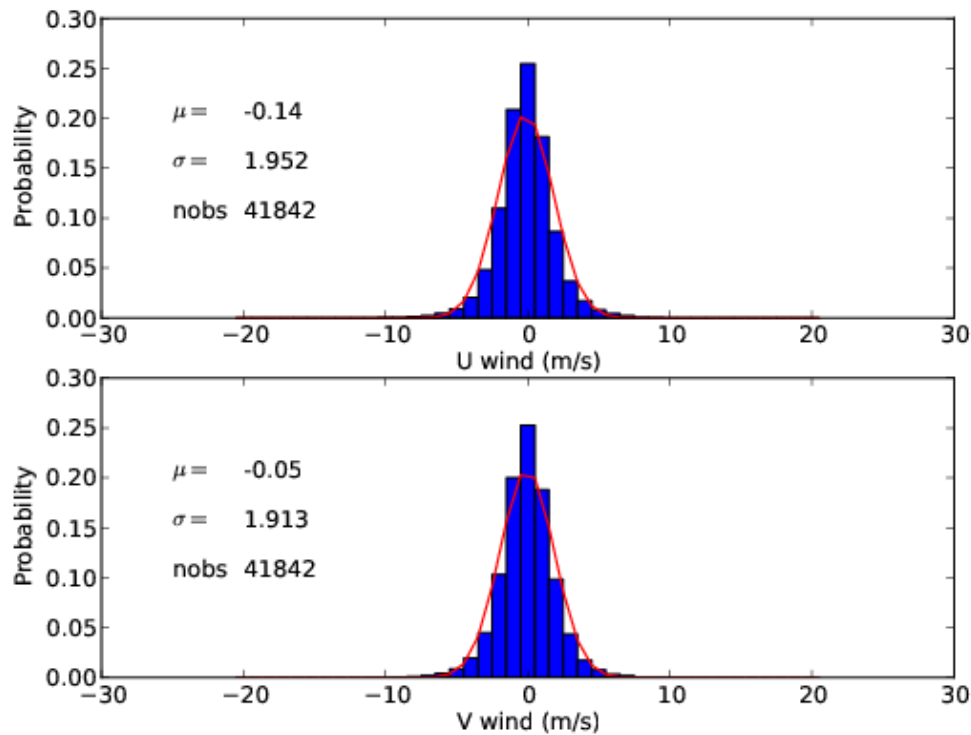

Mean RMS difference of MSLP between AA-REF and AA-SCAT experiments in the analysis (+00h forecast) averaged over March 2013.

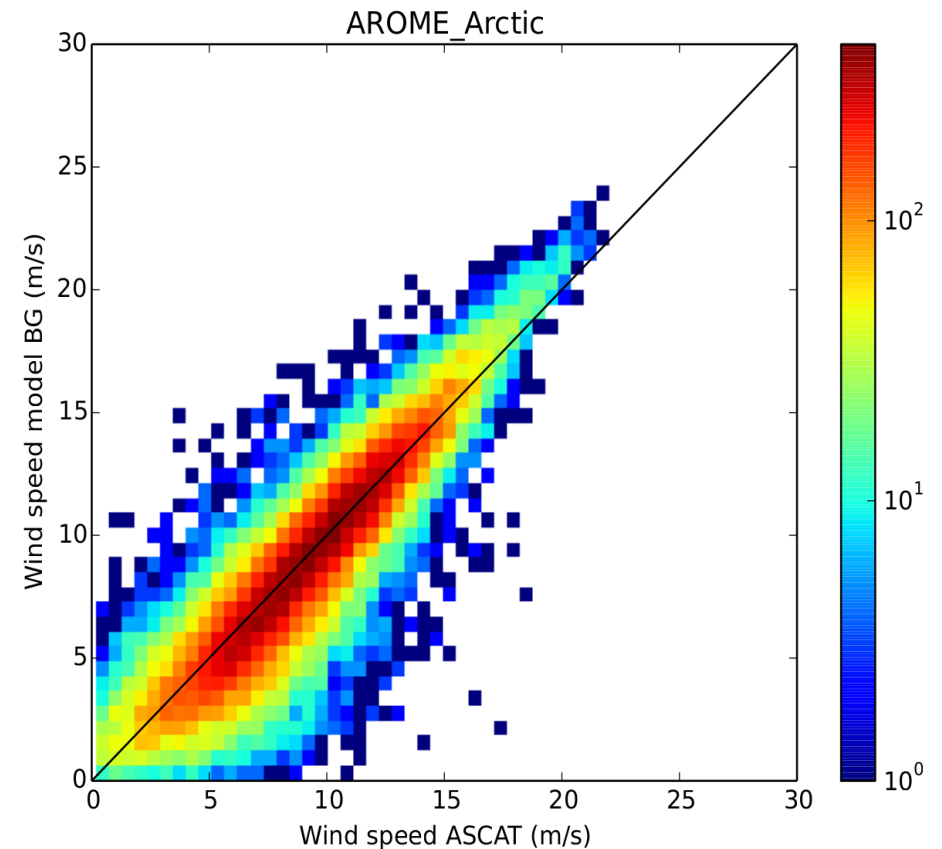

More about ASCAT impact:

Valkonen et al (2017) "Assimilating Advanced Scatterometer Winds in a High-Resolution Limited Area Model Over Northern Europe," *IEEE JSTARS*, doi: 10.1109/JSTARS.2016.2602889

ASCAT data usage in the operational setup

Background departure distribution for ASCAT zonal (upper panel) and meridional (lower panel) wind components in the daily runs of AROME-Arctic in January 2016.

Density scatter plot for absolute wind speed (m/s) calculated from the wind components for the assimilated ASCAT data and the background equivalent in the observation space in the AROME-Arctic system in January 2016

Sensitivity of the forecasts to the used observations sing Moist Total Energy Norm (MTEN) (*Storto and Randriamampianina, 2010*)

Normalized variability of the cost function over different dates
Forecast: 6 hours, Total Norm

The sensitivity of the forecast system with respect to the withdrawn observations from the analysis system

Normalized variability of the cost function over different dates
Forecast: 6 hours, Total Norm

MTEN over: Quarter1 Forecast +6h

MTEN over: Quarter2 Forecast +6h

MTEN over: Quarter3 Forecast +6h

MTEN over: Quarter4 Forecast +6h

MTEN over: Quarter1 Forecast +6h

MTEN over: Quarter2 Forecast +6h

MTEN over: Quarter3 Forecast +6h

MTEN over: Quarter4 Forecast +6h

Clear impact of AMV data on 6 hour forecast for some cases

Sensitivity of the forecasts to the used observations sing Moist Total Energy Norm (MTEN) (*Storto and Randriamampianina, 2010*)

Normalized variability of the cost function over different dates
Forecast: 12 hours, Total Norm

The sensitivity of the forecast system with respect to the withdrawn observations from the analysis system

Normalized variability of the cost function over different dates
Forecast: 12 hours, Total Norm

MTEN over: Quarter1 Forecast +12h

MTEN over: Quarter2 Forecast +12h

MTEN over: Quarter1 Forecast +12h

MTEN over: Quarter4 Forecast +48h

Impact of polar AMV on forecasts

Verification against radiosonde observations
RMSE of Wind Intensity (m/s) (AMV_NoP-AMV_2MP)
Period 20150905 – 20150930

Verification against radiosonde observations
RMSE of Geopotential (m) (AMV_NoP – AMV_2MP)
Period 20150905 – 20150930

Verification against radiosonde observations
RMSE of Relative Humidity (%) (AMV_NoP – AMV_2MP)
Period 20150905 – 20150930

Test period 1: 2015 Jul. 1-31; 4 days warming
period 2: 2015 Sept. 1-30

Similar impact was found for both periods over the Arctic

Impact of combined polar and geo-winds

Verification against radiosonde observations
 RMSE of Wind Intensity (m/s) (AMV_NoM-AMV_BSP)
 Period 20150905 - 20150930

Verification against radiosonde observations
 RMSE of Geopotential (m) (AMV_NoM - AMV_BSP)
 Period 20150905 - 20150930

Impact over the MetCoOp model domain

Test period 1: 2015 Jul. 1-31; 4 days warming
 period 2: 2015 Sept. 1-30

Significant impact on geopotential

Normalized mean RMSE diff (90% conf) AMV_NoM - AMV_BSP
 Selection: ALL using 21 stations
 Period: 20150905-20150930
 Height 500hPa Hours: {00,12}

Impact of individual wind product

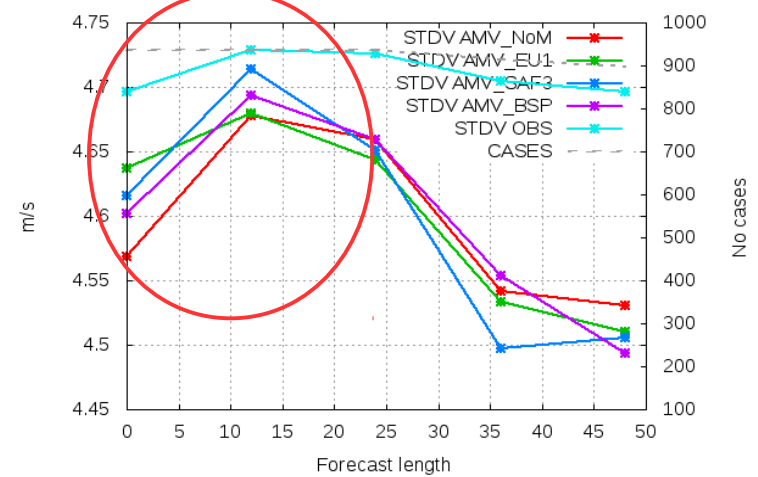

Symmetric Extremal Dependency Index for 12h Precipitation (mm/12h)
 Selection: ALL 140 stations
 Period: 20150905-20150930
 Used {00,12} + 18-06 30-18 42-30

12-h accum. Precipitation

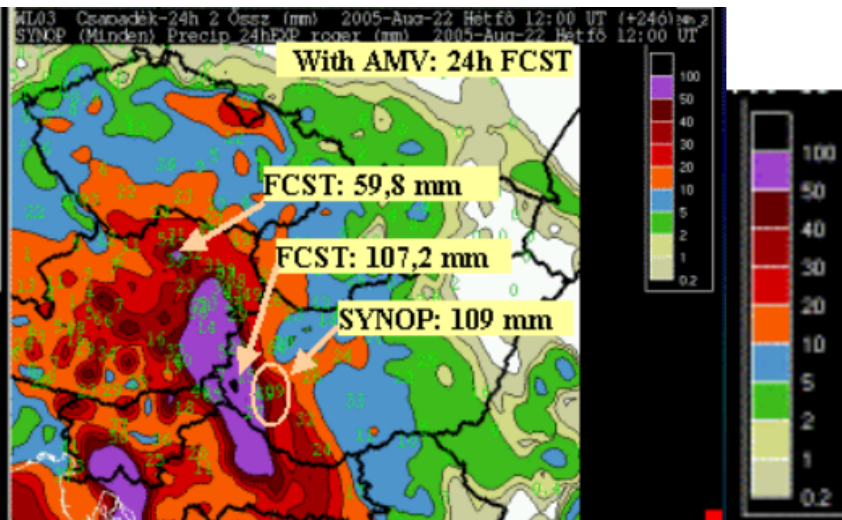

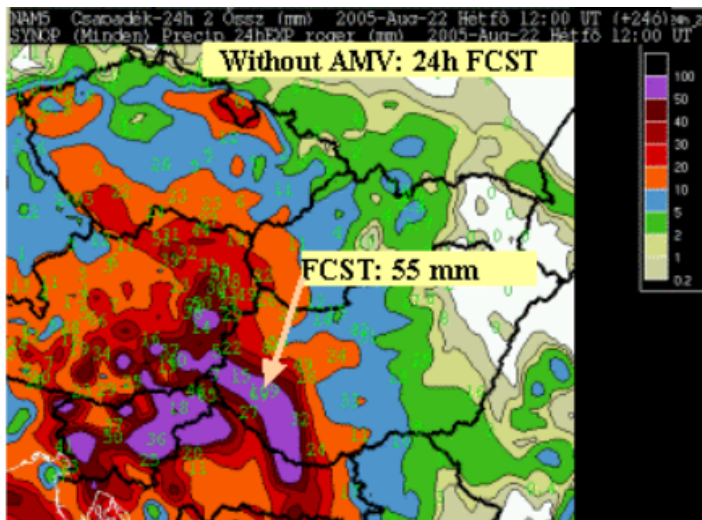

Red – control without AMV
 Green – with GeoEUMET
 Blue – with GeoSAF (HRW)

Selection: ALL using 21 stations
 Wind speed 850hPa Period: 20150905-20150930
 Hours: {00,12}

Wind speed at 850 hPa

Red – control without AMV
 Green – with GeoEUMET
 Blue – with GeoSAF (HRW)
 Magenta – with GeoSAF and Polar Wind

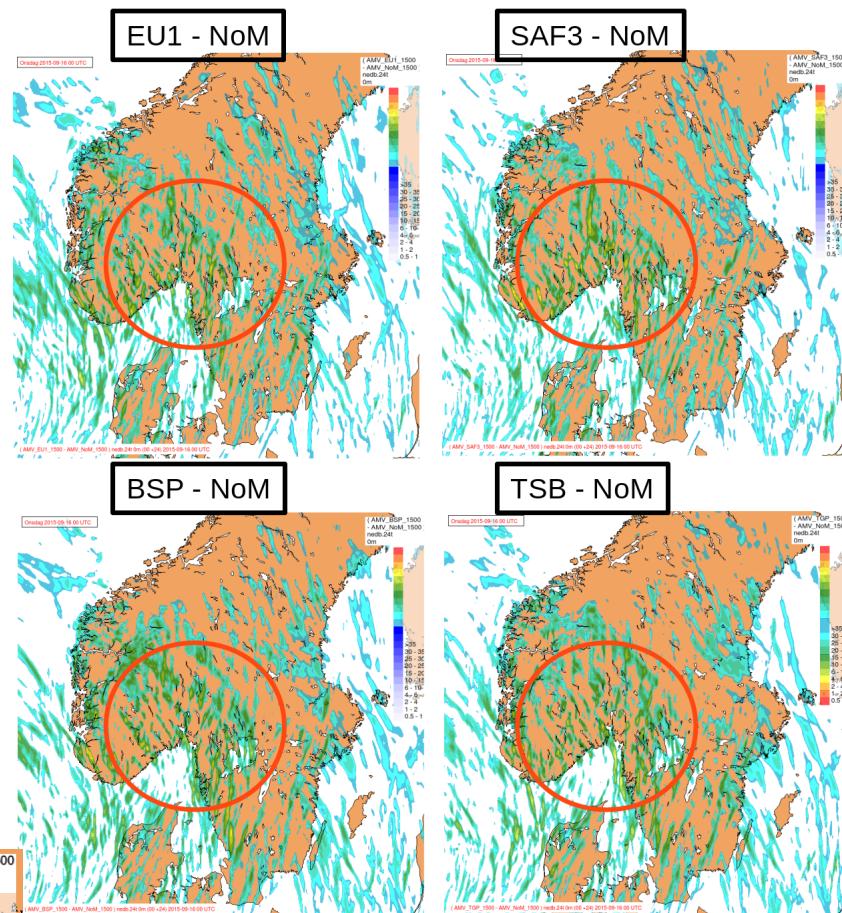

Old experiment showing the same impact on precipitation

Impact of Geowind on Aladin (Hungarian Met Service)

24-hour accumulated precipitation

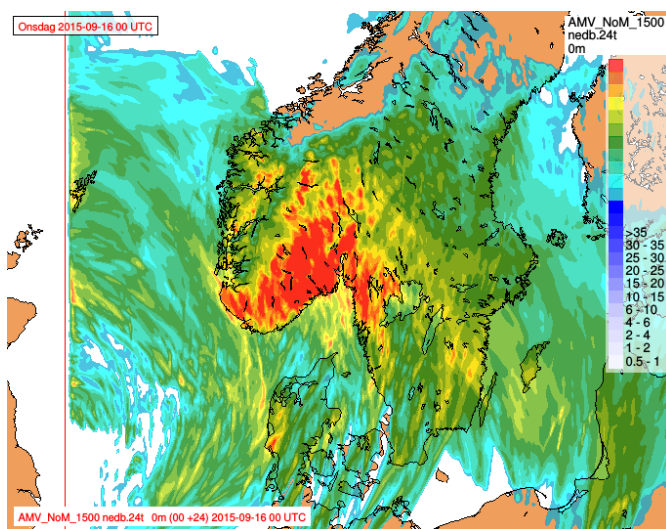

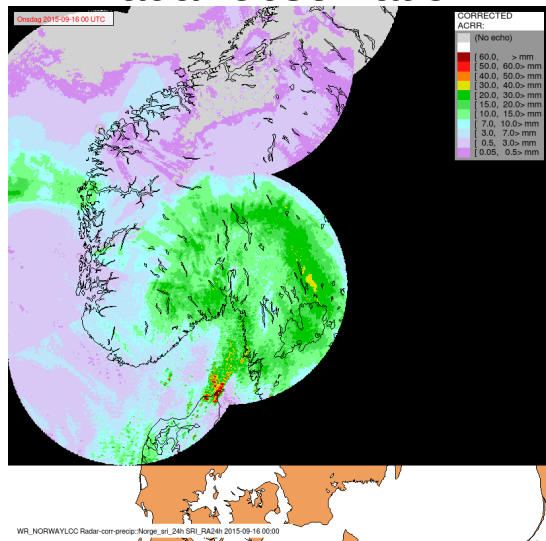

Impact of individual AMV on 12h and 24h accumulated precip

Symmetric Extremal Dependency Index for 12h Precipitation (mm/12h)
 Selection: ALL 139 stations
 Period: 20150905-20150930
 Used {00,12} + 18-06 30-18 42-30

Radar observation

NoM forecast

24-hours accumulated precipitation

- NoM – control without AMV
- EU1 – with GeoEUMET
- SAF3 – with GeoSAF (HRW)
- BSP – with GeoSAF and Polar Wind
- TSB – with All winds

Impact of GeoSAF (HRW) on rapid restart (RR) (Nowcasting using only GeoSAF)

Rapid restart using a 3 hourly cycled 3DVar (imitating the operational system) short-range forecasts (varying from 2 to 7 hours depending on the nowcasting time) as first-guess

Selection: ALL using 634 stations
Mslp Period: 20160802-20160827

Mean sea level pressure
Red – different short-range fcast valid at now time
Green – RR analysis (now time)

3-h accum. Precipitation fcast
without AMV – with AMV

Selection: ALL using 96 stations
3h Precipitation Period: 20160805-20160827
Hours: {21}

Mean sea level pressure
Red – control without AMV
Green – with GeoSAF (HRW)

Normalized mean RMSE diff (90% conf) AMV_NNWC - AMV_NWC
Selection: ALL using 22 stations
Period: 20160805-20160828
3h Precipitation Hours: {01}

Summary (1)

- We have now few projects dealing with different retrieved wind data.
- **ASCAT** have slightly positive impact on the analyses and forecasts of the Harmonie-Arome.
- **Geostationary AMV** have moderate positive rather than neutral impact on AROME-MetCoOp upper-air analyses and forecasts. The impact on the intense precipitation is clearly positive.
- The impact of the **polar winds** on the analyses and forecasts of the AROME-Arctic is clearly positive for both surface and upper-air variables.
- Using the **polar winds together with the HRW** significantly improved the accuracy of the analyses and forecasts of the AROME-MetCoOp model for both surface and upper-air levels.
- Using all **the three available wind data sets together** did not provide further clear improvement.
 - loss of accuracy in forecasts of precipitation, for example.
 - we probably have a redundancy problem with geostationary AMV data in the assimilation system.

Summary (2)

- Through **DFS** computation, **AMV data influence the analysis system** so that the surface observations show slightly less relative influence.
- The **sensitivity of the model to the AMV data** is slightly higher than that of the other observing systems used the analysis in case of non-stationary or intense weather phenomena.
- Taking into account the timeliness of the geostationary and polar winds,
 - The geostationary winds (HRW) was tested in the 1-hourly non cycling **rapid-refresh (RR) system**, where
 - Comparable impact as on the 3-hourly cycling DA;
 - Positive impact on forecasts of precipitation and cloudiness.

More about this study: https://www.met.no/publikasjoner/met-report/met-report-2017/_/attachment/download/f73796bf-5916-4eca-841f-5d8315455c13:80e930cb50b76b794672c2949c0b37c624f4d6d9/met-report-04-2017.pdf

Decisions:

==> The polar wind data are now finally included in the pre-operational Arome-Arctic model, which is under validation now.

==> The Geowind data will be tested in the nowcasting MetCoOp system.

Thank you for your attention!
