- Grid dimensions: 85X91X23
- Model top: 10 hPa
- Planetary boundary layer scheme: Blackadar (1979)
- explicit moisture scheme: Dudhia (1989)
- Cumulus Scheme: Kuo (1974)
- Background fields: NCEP GFS 12-h forecast

AMV data:

Provided by SMC/CMA

Derived from GMS-5 Water vapor and IR imageries

On average,

above 400 hPa : 95%

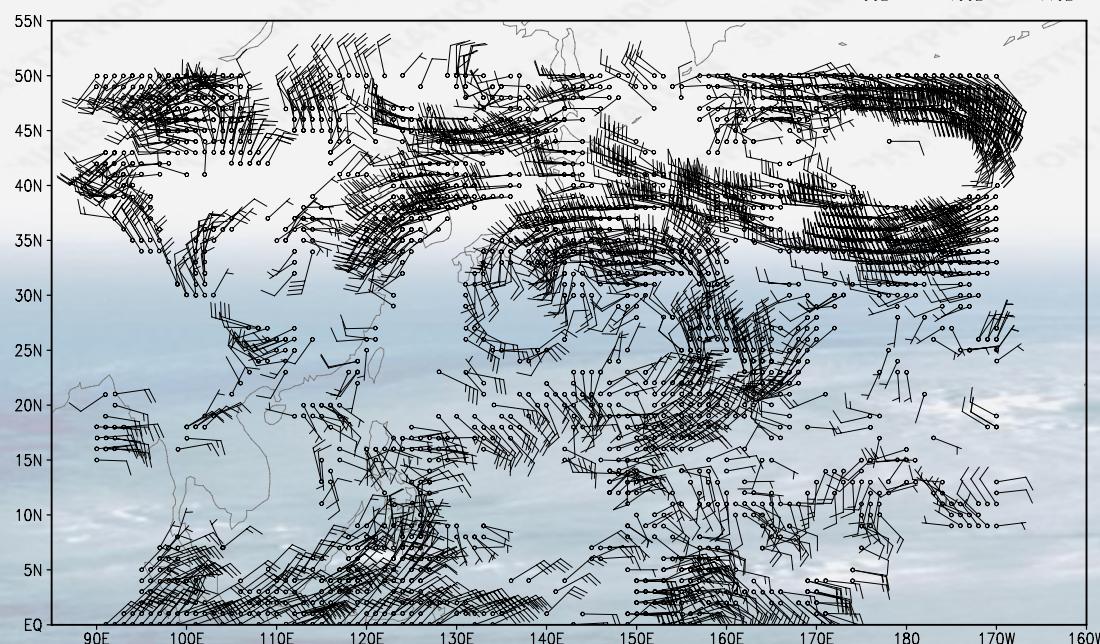

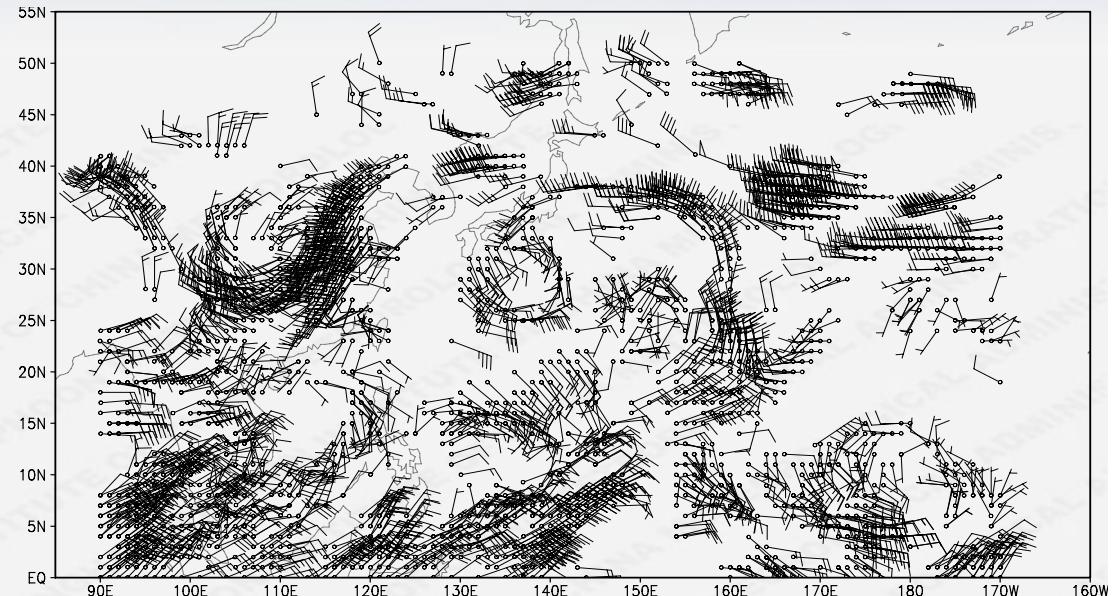

Between 200 and 300 hPa: 55%

1344 AMV observations are available within the model domain (about 3825 km X 4095 km),

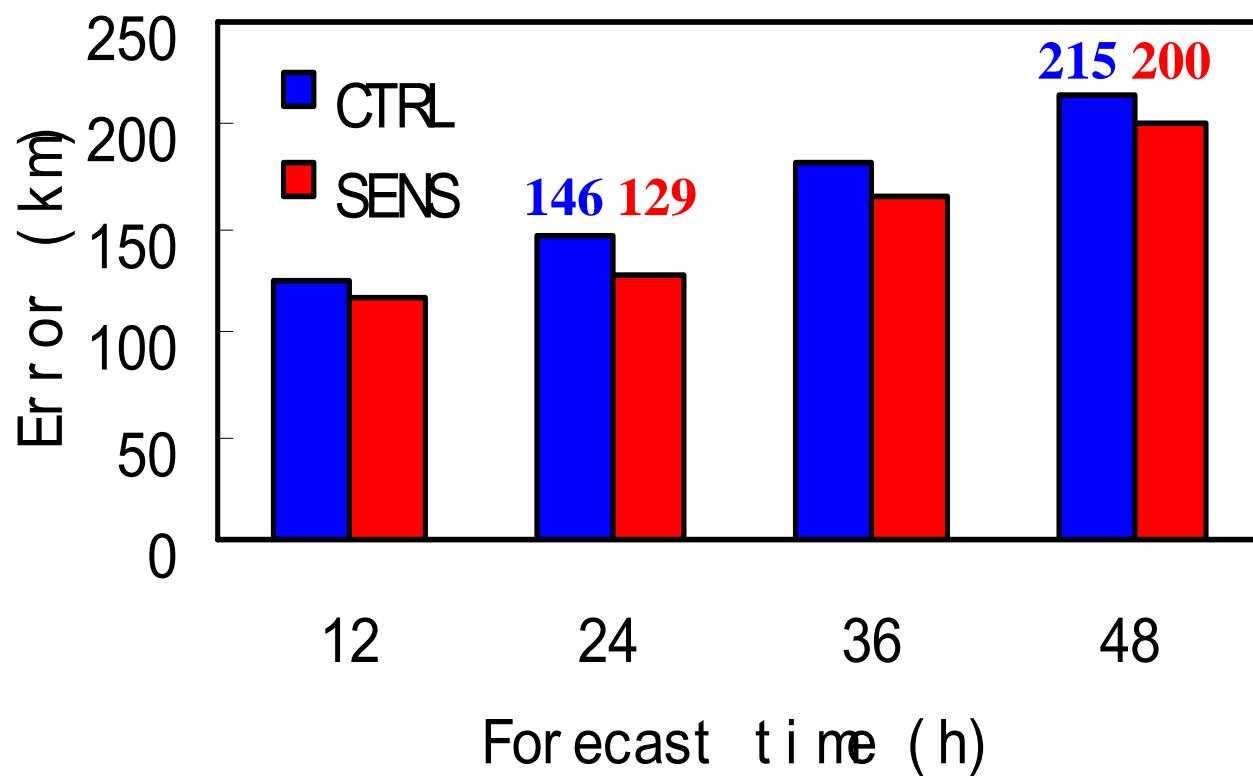

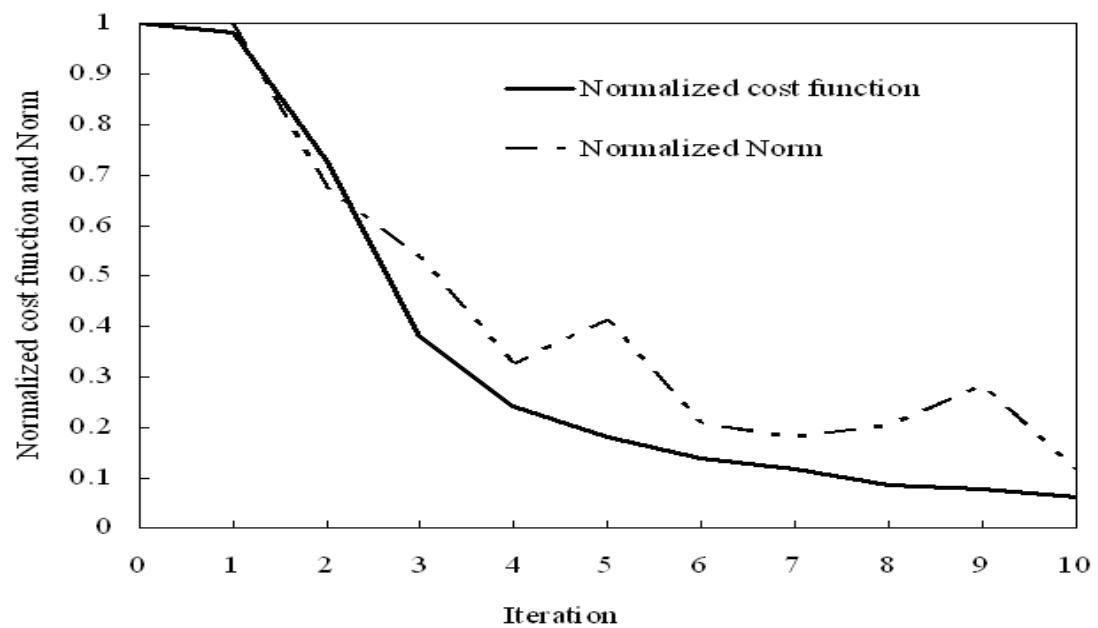

1200 UTC on 17 August GMS-5 infrared and water vapor AMVs

AMV Data at all levels, the average is 1344

Change of forecast error compared with CTRL	No. of cases with number of AMV observations	
	more	less
	than the average	
Reduced	27	21
No change	12	9
Increased	5	14

AMV Data below 400 hPa, the average is 57

Change of forecast error compared with CTRL	No. of cases with number of AMV observations	
	more	less
	than the average	
Reduced	33	15
No change	2	19
Increased	1	18

Outline

- Impact of 4D-Var Data Assimilation of AMVs on TC Track Forecasts
- Impact of model-constrained 3D-Var Data Assimilation of AMVs, AMSU-A and QuikSCAT on TC Track Forecasts

Model-constrained 3D-Var : Proposed by Dr. Xudong LIANG

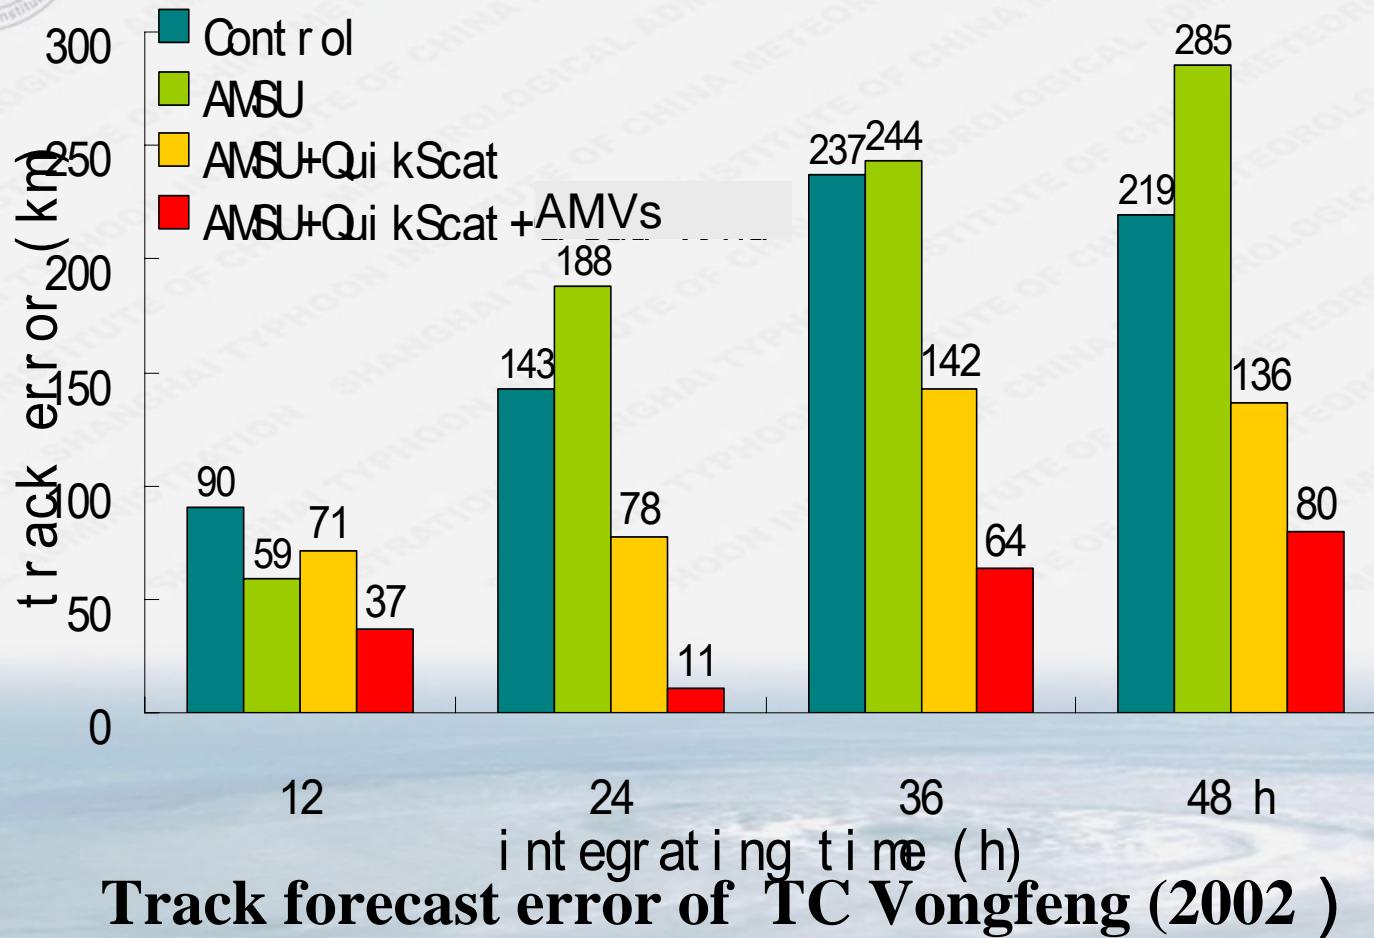

liangxd@mail.typhoon.gov

**Introduce model physical and dynamical constraints
into 3D-Var, to improve balance between analysis
variables.**

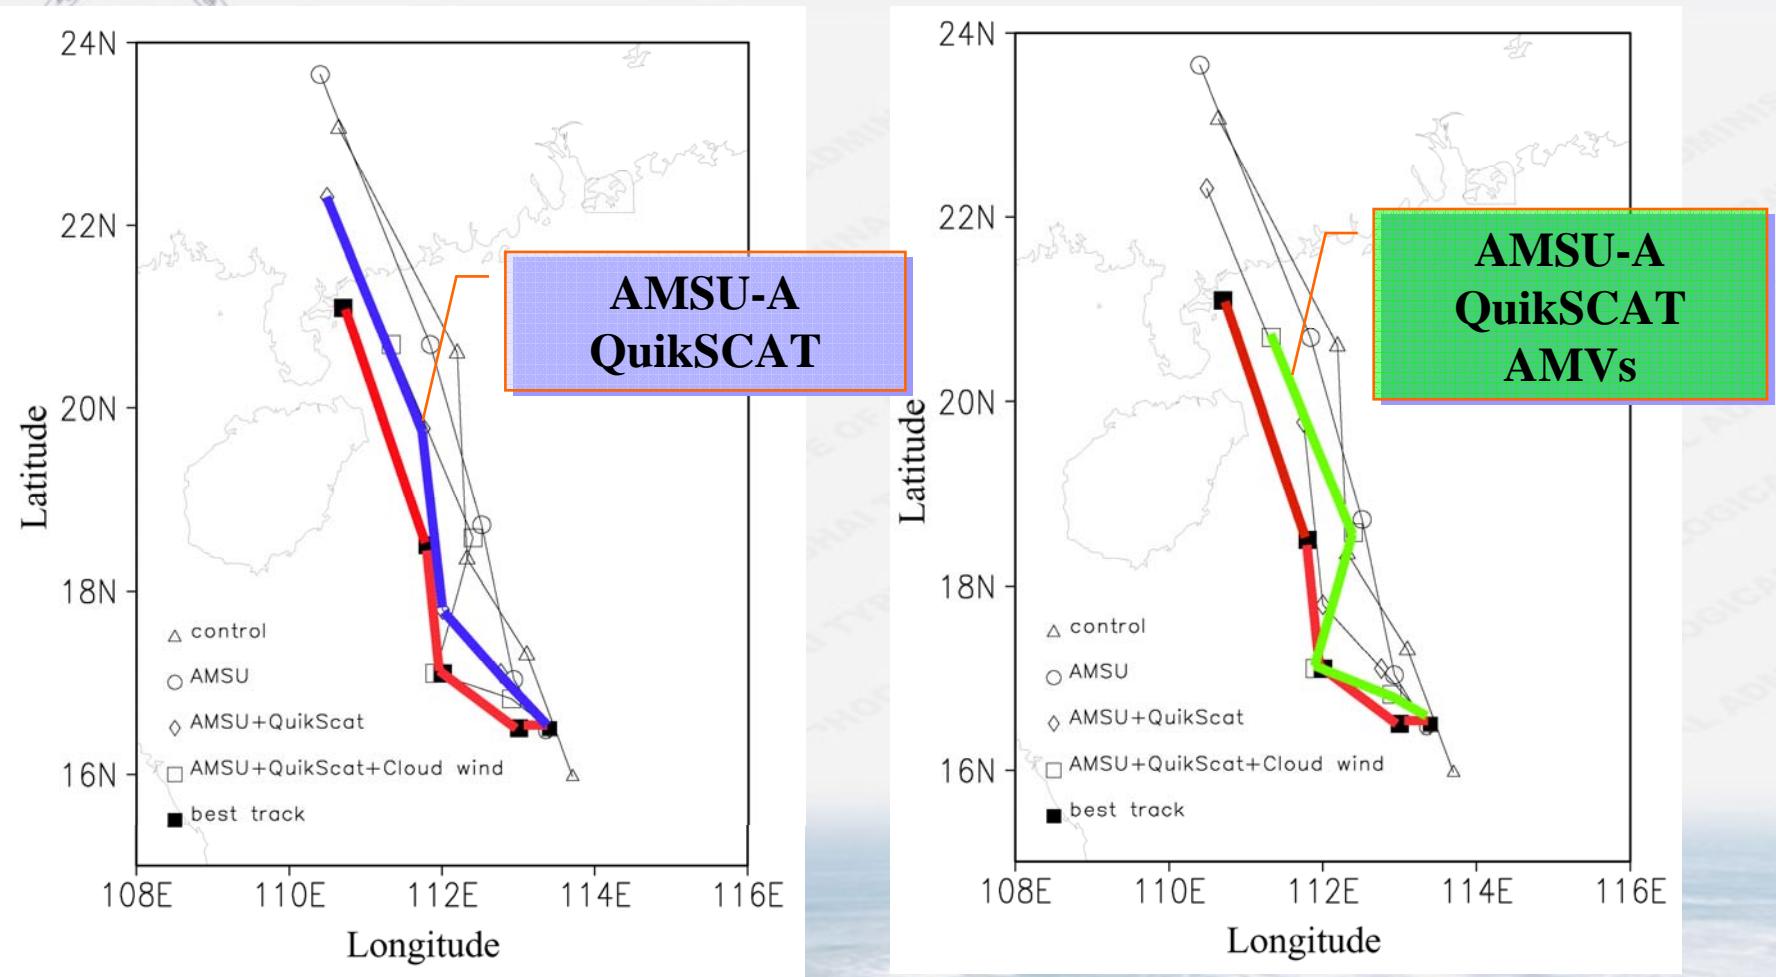

$$J = [x(t_0) - x_b(t_0)]^T B^{-1} [x(t_0) - x_b(t_0)] + [H(x(t_0)) - y_o(t_0)]^T O^{-1} [H(x(t_0)) - y_o(t_0)] + \left[\frac{\Delta x(t_0)}{\Delta t} \right]^T R^{-1} \left[\frac{\Delta x(t_0)}{\Delta t} \right]$$
